

Emergency Response

24 Hour Hazardous Material Technician Level

Our 24-hour technician level course is full of interactive training. We discuss topics such as hazard assessment, personal protective equipment, respiratory protection, decontamination, and involve the participants in hands-on use of the equipment. As previous trainees themselves, our trainers are able to effectively guide engaging programs. By involving the participants, we achieve better understanding and get high marks among our trainees for the knowledge-sharing that occurs during our training. The guidance provided from our instructors is real world. Our trainers have been there, and understand the complexity of hazardous material emergency response.

Emergency response topics include:

- Incident command
- Respiratory protection
- Chemical protective clothing
- Toxicology
- Hazard assessment
- Monitoring and sampling
- Control techniques
- Decontamination
- Container recognition.

Simulated emergency drills and workshops bring together the elements of emergency response. The responders attending this seminar will understand basic response techniques and should, as needed, be able to adapt these techniques to facility-specific requirements. We also offer a 40-hour HazMat tech course which provides more in depth, hands-on knowledge.

STEP...up to compliance!
