

# Emergency Response

Training emergency responders is what our company does best! We offer incident command, hazardous material technician level, operations level and awareness level refresher training.

In this new 40-hour course you will see that we take emergency response training and apply everything learned in hazmat technician level training into hands-on interactive training. This training is geared toward responding to a release for the purpose of mitigating the incident. Incident command strategies, hazard assessment, understanding of tactical operations and entry procedures are taught in an applied format.

Management of a scene is a critical component of emergency response control measures. This course uses our 80% rule, to set up scenarios and let the participants activate the emergency team and "play out" the emergency training drill. *Our 80% rule is to spend 80% of the time having the participants do and not just listen!* This is the best way to help ensure that participants are going to retain and be able to use the information they receive during training. If onsite, we can tailor training sessions to include a variety of formats based on what the client needs for their team. For over 20 years we have been taking information from clients, pulling it together in an energized training format, and providing, according to our clients, the best emergency response training. Come see for yourself.

Everyone "says" they do customized training; but our emergency response training reputation was built on client-specific customized training. We save you time by working with you to get to know your chemicals, your processes and your team's organization. Need refresher training? We can provide a training strategy that builds on each year's training to help maintain emergency response competency - a requirement of OSHA's emergency response standard.

*STEP...up to compliance!*
