

# RCRA-Hazardous Waste Management

This eight-hour hazardous waste course provides a detailed discussion of solid and hazardous waste management requirements. We work through the myriad of hazardous waste regulations, including how to classify hazardous waste, what type of shipping containers are needed, the use of the hazardous waste manifest and contingencies for hazardous waste emergencies.

Interactive case studies allow the participants to take the information provided and apply it to the situation they have been given. Anyone who generates hazardous waste is required to complete an annual training course. This eight-hour seminar provides the tools needed to maintain compliance for the person working with manifests, in charge of compliance, or classifying facility waste.

Our objectives for this class include:

- Hazardous waste regulations
- Generator status
- Identification
- Managing hazardous waste
- Storage areas
- Requirements for record keeping
- Annual training information
- Land disposal restrictions

We also provide this training class in a four-hour format, focusing on the requirements your employees need to know for annual training compliance. These include facility hazardous waste, storage, safe handling, labeling, hazards and contingency planning. A two-hour DOT Hazardous Waste function-specific class is also available.

*STEP...up to compliance!*
